

Haemequine

What trainers are saying after they've tried HAEMEQUINE for 28 days.....

"My horse became more aggressive in work outs and training."

Three of my horses achieved new lifetime marks."

Blood counts moved up in readings sharply."

My horse is finally achieving the performance I always knew it should have."

Haemequine did exactly as you stated, I am now feeding it to several of my horses and have seen improvement in their performance."

FEEDING RATE

1 scoop = 10 grams

(1) TO ASSIST HEALING OF BLEEDERS

Feed 20 grams (2 scoops) daily added to the daily ration for ten (10) consecutive days.

(2) Feed 10 grams (1 scoop) daily for the next eighteen (18) successive days.

(3) VERY IMPORTANT:

To assist in rapid and effective healing of "bleeders" it is strongly recommended that the horse be rested from strenuous training, fast workouts and competitive racing during the first twenty-one (21) days of treatment.

For Pre Race give 2 scoops at least 5 hours out. See Pre Race Formulae Sheet.

If the horse does not accept Haemequine naturally it may be mixed with molasses or drenched.

Haemequine is not recommended for pregnant or nursing mares.

Haemequine

HAEMEQUINE is the newest addition to the family to quality supplements designed specifically for equine athletes.

The development of **HAEMEQUINE** required years of extensive research to isolate and identify those nutrients which are most often depleted under the excessive stresses of training and racing.

HAEMEQUINE is an all natural nutritional supplement which is designed for addition to the daily grain ration.

HAEMEQUINE is safe and drug free. There are no known adverse reactions or side effects when **HAEMEQUINE** is used as indicated.

Product Analysis: Per Kg

Protein.....	14.65%

HAEMEQUINE

Haemequine, a 100% natural feed supplement that can really help your horse.

Recent research on race horses has shown that when horses were scoped immediately after a race, 75% showed indications of varying degrees of exercised induced pulmonary haemorrhaging (EIPH). A fact many of us realized before science confirmed it.

Studies have also shown that horses under the stressful conditions of racing and training with pulmonary bleeding inevitably leads to an overall degeneration of the horse's health condition, lackluster performance and eventually an early retirement from their racing career.

Haemequine & EIPH

Haemequine was designed to address all aspects of these health related problems. **Haemequine** uniquely assists in meeting the cellular requirements of the **Haematopoietic** (Blood forming) system and the vascular (artery, capillary veins, etc.) system of an equine athlete.

100 % Natural

Haemequine: A Natural Aid In the Fight Against EIPH

Haemequine replaces the depleted sources or essential active vitamins, enzymes, minerals and cellular components which are necessary for the formation of blood components.

The presence of these varied elements is most essential for the healing process to begin.

Haemequine enables the vascular and homeopathic system to interact and perform at their highest levels of efficiency.

Haemequine restores the depleted reserves of the essential building blocks which protects the distressed athlete from becoming prone to pulmonary induced haemorrhaging.

Haemequine is not a Diuretic

Diuretics are known to significantly increase the amount of urine secreted.

These losses add even more to an already stressed animal which just compounds the problem. Studies have indicated that diuretics do not improve the performance of the horse and further that some diuretics failed to stop bleeding in 62% of the bleeders that were treated.

Trial Results

Studies were conducted on several high performance animals suffering from pulmonary induced haemorrhaging. After twenty eight consecutive days of feeding the recommended dose a drastic reduction in pulmonary bleeding was experienced. The horses involved became visibly healthy in appearance and showed no lack luster or stressful tendencies.

Haemequine has been thoroughly tested and could give good results in the majority of cases making it's use clearly indicated in the prevention of bleeding in uncomplicated cases resulting from certain nutritional deficiencies and capillary fragility. No specific claims are being made that **Haemequine** will control or cure all cases of bleeding.

Haemequine is a treatment to be seriously considered, prior to the administration of commonly accepted diuretic therapy.
